invention provides a method for identifying differentially expressed nucleic acids between two a) selecting a first and second samples, comprising: nucleic acid sample; b) producing libraries for the first and second nucleic acid sample; c) performing reciprocal libraries to produce between the subtraction subtracted libraries; d) amplifying the two subtracted libraries; and e) comparing the two amplified subtracted libraries to identify differentially expressed nucleic acids. Also, this invention provides the above-described wherein the 3' primer used in the PCR method, amplification is an oligo dT 3' primer. This invention also provides the above-described methods, wherein the comparing of step e comprises using a gel to separate the nucleic acids from both of the libraries. This invention provides the isolated nucleic acid identified by the the above-described methods, wherein the nucleic was not previously known to be differentially expressed between the two samples.
